Literature Seminar

Golnaz, Mirja, Petrine, Victoria & Saeedeh

Main arguments of each article

In general, they argue that AI and digital tech being used in education is overhyped, some see it as a solution for all our educational problems but we need to think more critically about it - could be used in specific situations/contexts, but not as an overall solution for everything.

Discrimination and algorithmic bias affect social minorities and underprivileged students.

People and the educational system having to become AI/machine readable.

Counterarguments to the main arguments

The novelty of AI creates uncertainty.

AI is trained on our biased, racist data. AI as a system might not necessarily exhibit these tendencies.

AI merely simulates text patterns rather than processing true knowledge or understanding and ignores human pedagogical values. General Artificial Intelligence is only a theory as of right now.
